

SOLID WASTE MANAGEMENT

Why Collection & Transportation using Garbage Compactors is more than just a luxury. Below are some of the reasons why an effective Collection & Transportation systems for Municipal Solid Waste is more than just a compliance issue:

- **Reduces Collection & Transportation Cost**

Compactors compress garbage and increase their specific weight. This enables maximum payload utilization of chassis, thereby minimizing cost of collection and transportation.

- **Protects your Collection & Transportation Crew from Occupational Health Hazards**

Due to manual handling of Garbage, cleaning crew often suffers from infection, skin diseases and other occupational hazards.

- **Reduces Waste from Entering Storm Water Lines**

Uncollected MSW often finds way into the sewerage & storm water network, because of wind rain and open manholes. Thus causing blockages and water logging during monsoons.

- **Reduces Traffic Congestion**

Inefficient Collection & Transportation systems add to the vehicle fleet strength, causing traffic congestions and higher fuel consumption.

- **Minimize Social Inconvenience**

An inefficient SWM can cause great social inconvenience; and is a threat to any and

every form of epidemic. Collection of garbage also attracts rodents and stray animals.

- **Reduces Accidents and Injury**

Manual Collection & Transportation System exposes the cleaning crew to unscientific and accident prone work conditions, leading to fatal accidents. Comply with Prohibition of Manual Scavenging Act, 1993.

- **Trash breeds Trash**

Periodic cleaning can aid in keeping a clean workplace cleaner. A study by Human Resources Institute states that people have little or no hesitation in throwing litter in a littered place!

- **Reflects Efficiency of the Civic Authorities**

Often a city of choice is a city with an efficient Civic Authority, which adds greatly to the feeling of pride.
